

Implement Client Script & UI Policy (Incident)

ServiceNow Incident Management Optimization Project Report

TEAM IDENTIFICATION

Team ID: SWTID-2026-7761

TEAM COMPOSITION

Team Size: 5 Members

Project Roster

Role	Name
Team Leader	KAVYASRI. M
Team Member	Mathavi. M
Team Member	Nathiya M
Team Member	santhanalakshmi k
Team Member	Senthamilselvi

Phase 1 Brainstorming & Ideation Phase

During the initial phase, the team identified key friction points in standard Incident Management workflows. The main objective was to enhance user experience and data integrity on the Incident form using dynamic client-side scripting and declarative policies.

Core Ideation Focus Areas

- Reducing form submission errors by dynamically enforcing field requirements based on state changes.
- Improving agent efficiency through automatic field population and validation warnings.
- Balancing performance by choosing appropriately between Client Scripts and UI Policies.

Phase 2 Requirement Analysis Phase

Requirements were mapped into explicit Client Script and UI Policy functional specifications:

UI Policy Requirements

- Make **Resolution Notes** and **Close Code** mandatory only when State changes to *Resolved*.
- Hide operational fields when an incident is newly created.

Client Script Requirements

- Validate caller contact information on form load (`onLoad`).
- Alert agents if high-impact priority is selected (`onChange`).
- Verify mandatory fields prior to final

Phase 3 Project Design Phase

The system architecture prioritizes UI Policies for no-code field property manipulation (Mandatory, Read-Only, Visible) and reserves Client Scripts exclusively for complex procedural logic and client-side alerts.

Architecture Decision Matrix

Selecting the optimal tool based on logic requirements:

Requirement Type	Mechanism Used	Execution Timing
Field Visibility / Mandatory Rules	UI Policy & Actions	On Load / Field Value Change
Complex Alert & Validation Logic	Client Script (onChange / onSubmit)	User Interaction Events

Phase 4 Project Planning Phase

Work was divided across team members to maintain structured execution across sprint cycles:

Work Breakdown Structure

- **KAVYASRI. M:** Lead architecture, code reviews, and UI Policy configuration.
- **Mathavi. M & Nathiya M:** Client Script development (`onChange` & `onSubmit`).
- **santhanalakshmi k:** Testing scenario creation & UAT execution.
- **Senthamilselvi:** Technical documentation and demonstration prep.

Milestones & Schedule

- **Sprint 1:** Requirement validation & Architecture design.
- **Sprint 2:** Implementation of Client Scripts & UI Policies.
- **Sprint 3:** Quality assurance, debugging, and user acceptance.
- **Sprint 4:** Final documentation and live demonstration.

Phase 5 Project Development Phase

Development was completed in the target ServiceNow instance focusing on the `incident` table.

- **UI Policy Implementation:** Created "*Mandatory Resolution Details on Resolve*" with conditions set to `[State] [is] [Resolved]` . Associated UI Policy Actions for `close_code` and `close_notes` set Mandatory to `true` .
- **Client Script Implementation:** Developed `onChange` script on `urgency` field to trigger modal pop-ups when Urgency level 1 is selected, prompting immediate triage procedures.

Phase 6 Project Testing Phase

Comprehensive test cases were executed to ensure functionality and verify zero performance regression during form loading.

Test ID	Scenario	Expected Result	Status
TC-01	Change Incident State to 'Resolved'	Close Code and Resolution Notes become mandatory	PASSED
TC-02	Set Urgency to High (1)	Client script displays triage alert confirmation dialog	PASSED
TC-03	Submit Incident without required fields	Form submission blocked with error message	PASSED

Phase 7 Project Documentation Phase

Standard Operating Procedures (SOPs) and technical documentation were produced to enable future platform maintainability:

- **Technical Specification Document:** Maps field names, script conditions, and system dependencies.
- **User Guide:** Explains updated Incident form behavior for IT Service Desk agents.
- **Maintenance Log:** Contains version control notes and update set tracking details.

Phase 8 Project Demonstration Phase

Demonstration Summary

The final project walk-through successfully demonstrated to key stakeholders:

1. Dynamic form reaction without full page reloads when toggling incident states.
2. Seamless validation checks protecting incident data completeness before workflow transitions.
3. Clean implementation following ServiceNow best practices (preferring UI Policies over Client Scripts where feasible).
